When the air-fuel ratio is lower than the stoichiometric ratio, the air-fuel mixture is called rich. For example, for a gasoline engine, an AFR of 16.5:1 is lean and 13.7:1 is rich. In the table below we can see the stoichiometric air-fuel ratio for several fossil fuels.

Amount of fuel plus enrichment = $(6.5:1) / (3.4:1) = 1.91$ or 91-percent rich. The actual ratio of the weight of air to the weight of fuel was computed over several test runs by using an MFI fuel injection jetting calculator. Fuel injection jetting was adjusted until an optimum spark plug reading was achieved.

I would much rather look at my air to fuel ratio than a bright orange light. I ran the wires behind the dash to keep them out of sight and make sure my car looks neat. Once you place and run the wires of your Air/Fuel ratio gauge, it is time to start hooking the wires up. Step 6: On my gauge, there are 3 wires. Here is the descriptions...

5.2.3.3 Air/gas fuel ratio. The air mass flow rate shall always be in a ratio with the gas mass flow in order to ensure safe ignition and that throughout the operating range, a stable and safe combustion is maintained at each individual burner. The ratio needs not be the same value at all operational conditions.
