On FreeBSD, the built-in ntpd can be used to synchronize a system's clock. Ntpd is configured using rc.conf (5) variables and /etc/ntp.conf, as detailed in the following sections. Ntpd communicates with its network peers using UDP packets. Any firewalls between your machine and its NTP peers must be configured to allow UDP packets in and out on port 123.

## 29.11. Clock Synchronization with NTP - FreeBSD

In order to make sure that ntpd will set the clock it should be run with the -g switch. Or if you do it by hand "ntpd -g -n". The last switch is to make sure that it does not fork. The first sets the time regardless. Watch the messages and exit using ^C. If it does not work, try using it with two -g switches.
